## DETAILED ACTION

### *Claim Rejections - 35 USC § 103*

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Claim 1 is rejected under 35 U.S.C. 103(a) as being unpatentable over Schmidt in view of Ueno.

As per claim 1, Schmidt teaches a refrigeration cycle comprising compressor 20, first liquid heat exchanger 14a, expansion device 22, second liquid heat exchanger 26a, air heat exchanger 14b, and the compressor inherently acting as a refrigerant flow rate adjuster based on the operating capacity of the compressor. Schmidt does not teach controller maintaining a minimum flow rate within the air heat exchanger in order to prevent stagnation when both the first liquid heat exchanger and the air heat exchanger are operating. However, the general concept of maintaining a certain flow rate through a heat exchanger to prevent stagnation is old

and known in the art. Ueno, for example, teaches operating the evaporator at all times (thus above a minimum zero value) to prevent stagnation in the evaporator (column 14, lines 20-25). It would have been obvious to one of ordinary skill in the art at the time the invention was made to apply such stagnation prevention controls to the air heat exchanger of Schmidt for this same general purpose, regardless of how the rest of the refrigeration cycle is constructed.

#### ***Allowable Subject Matter***

Claims 2-4 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
